Sales Performance Analysis Project Documentation

Business Problem Statement

Businesses need to monitor their sales performance to understand which products, regions, and time periods generate the most revenue and profit. Without proper analysis, companies cannot identify high-performing products or detect loss-making areas. This project analyzes retail sales data to provide insights that help improve business decision-making.

1. Project Overview

This project analyzes a retail sales dataset to evaluate overall business performance. The objective is to identify revenue trends, top-performing products, regional performance, and profitability patterns using Microsoft Excel. The analysis uses pivot tables, charts, and an interactive dashboard similar to a Power BI analytical dashboard.

2. Dataset Description

The dataset contains around 500 sales transaction records with the following fields:

- Order ID
- Order Date
- Month
- Region
- City
- Category
- Product Name
- Sales
- Quantity
- Discount
- Profit

3. Data Preparation

- Checked for duplicate records.
- Verified correct date formatting.
- Validated numeric columns such as Sales, Profit, Quantity and Discount.
- Handled missing or inconsistent values.
- Created calculated metrics such as Profit Margin.

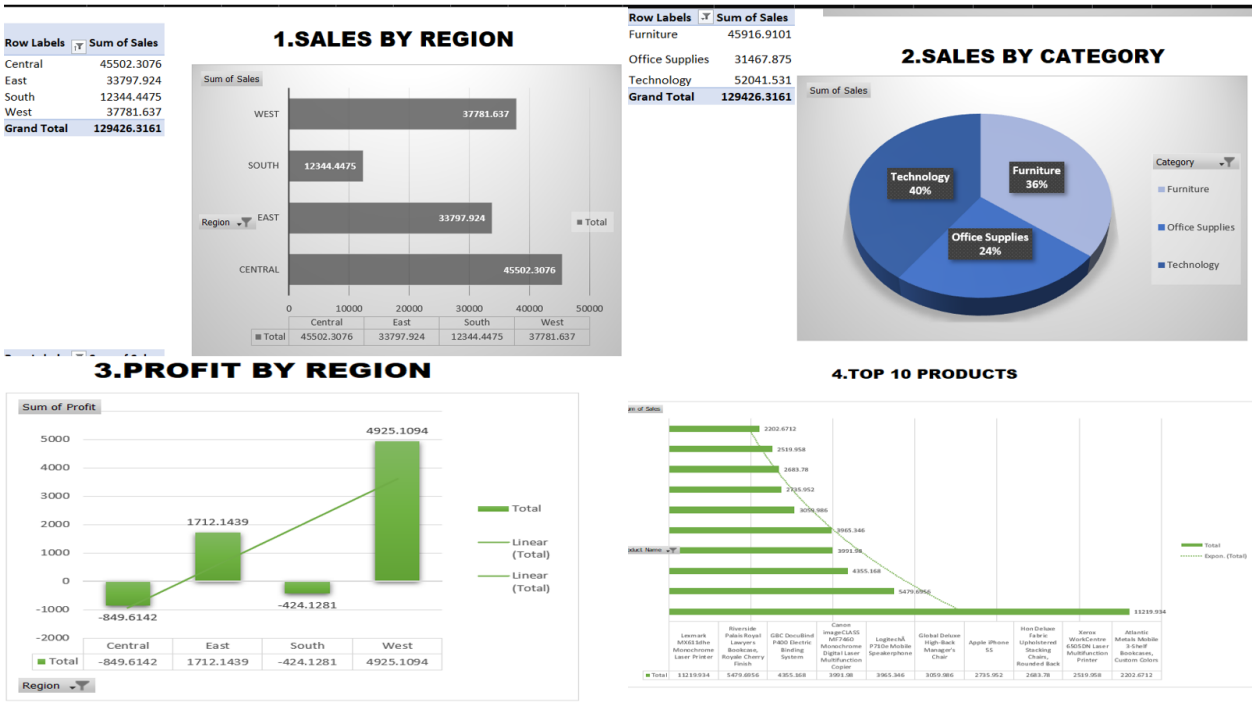
4. Key Performance Indicators (KPIs)

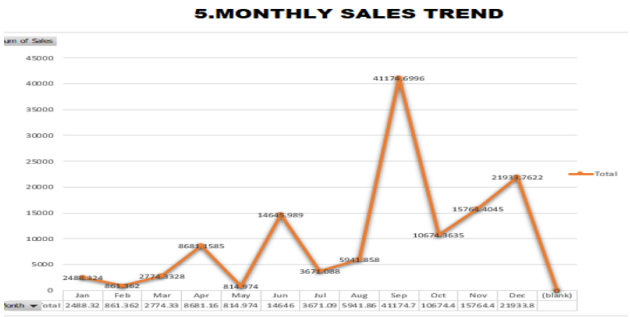
The dashboard highlights important performance metrics:

- Total Sales
- Total Profit
- Total Quantity Sold
- Profit Margin (Profit ÷ Sales)

5. Dashboard Overview

The dashboard provides a complete visual overview of sales performance. It combines multiple pivot charts and KPIs to help users quickly understand regional sales performance, category contribution, profit distribution, top-performing products, and monthly sales trends.





The dashboard includes the following analytical components:

- Sales by Region – compares revenue generated across different geographical regions.
- Sales by Category – shows contribution of Technology, Furniture, and Office Supplies categories.
- Profit by Region – highlights which regions generate the highest and lowest profit.
- Top 10 Products – identifies products generating the highest revenue.
- Monthly Sales Trend – shows how sales change over different months.

6. Interactive Dashboard Features

- Slicers for Region, Category, and Month to filter data interactively.
- Pivot charts update dynamically when filters are applied.

- KPI indicators summarizing overall business performance.

7. Key Business Insights

- Central region generates the highest sales revenue.
- Technology category contributes the largest share of total sales.
- Some regions generate lower profit due to higher discounts.
- Sales show seasonal fluctuations across months.

8. Business Recommendations

- Optimize discount strategies to improve profit margins.
- Focus marketing efforts on high-performing product categories.
- Improve strategies in low-performing regions.
- Plan inventory and promotions based on seasonal demand patterns.

9. Conclusion

This project demonstrates how Excel dashboards can transform raw sales data into meaningful business insights. The interactive dashboard allows decision makers to quickly analyze performance and make data-driven business decisions.
